HOW MEDIA QUERIES WORK (WITH MAX-WIDTH)

Media query

STRATEGIES FOR SELECTING BREAKPOINTS

BAD

Based on popular devices

GOOD

Based on screen width ranges

PERFECT

When design breaks down

Where To
Write It?

<https://css-tricks.com/snippets/css/media-queries-for-standard-devices/>

Screen sizes

Extra small. < 576px	xs
----------------------	----

Small ≥ 576px	sm
---------------	----

Medium ≥ 768px	md
----------------	----

Large ≥ 992px	l
---------------	---

Extra large ≥ 1200px	xl
----------------------	----

Measurement Units

Measurement Units

Relative length units specify a length relative to another length property. Relative length units scale better between different rendering medium.

Unit	Description
em	Relative to the font-size of the element (2em means 2 times the size of the current font)
rem	Relative to font-size of the root element
vw	Relative to 1% of the width of the viewport*
vh	Relative to 1% of the height of the viewport*

difference between em and rem

While **em** is relative to the font-size of its direct or nearest parent, **rem** is only relative to the html (root) font-size.

em gives the ability to control an area of a design. As in, scale the type in that specific area relatively.

rem gives the ability to scale type across the entire page easily.

Notice:

The default size, if one has not been defined, is 16px = so 1em/rem = 16px.

THANKS
